

APPLICATION VIRTUALIZATION WORKSHOP

Infrastructure Workshop

Never Install Software Again! Never Worry About Application Conflicts! Minimize Application Testing and Compatibility Issues!

With Microsoft's SoftGrid Application Virtualization, users and their application environments are no longer machine-specific, and the machines themselves are no longer user-specific.

This enables IT to be flexible and responsive to business needs, and significantly reducing the cost of PC management, including application and operating system (OS) migrations.

With application Virtualization, maintaining the desktop is much simpler because now the administration of the desktop uses automated tasks for deploying, patching and updating applications which require fewer resources and make your organization more responsive to the ever-changing application needs of a complex user base.

Omicron's Application Virtualization Workshop: Preparing the Enterprise for Virtualization

Minimizing application conflicts and regression testing - By eliminating the need to install applications on the desktop computer, virtualization prevents problems that would otherwise impact the performance or deployment process.

Simplifying operating system upgrades and patching - By eliminating the need to repackage an application for an operating system upgrade, deploying an upgraded operating system is easier than ever.

Maintaining business continuity - Because you can replicate applications and data, an instant-on recovery method can easily be supported through application virtualization. All user specific applications can be replicated to a backup site.

Securing the desktop - Application permissions and licensing is centralized protecting you from unauthorized software use. Because the system is so clean, it can prevent security breaches and infections through effective patch management.

Omicron leads the Enterprise through all the technology decisions and steps to ready the environment for Application Virtualization. Through a targeted, fast-paced process, Omicron establishes your requirements around application virtualization and demonstrates how easy it is to move your application management to the next level.
